PT Detecting cancers, particularly of prostate and colon, from
PT overexpression of SGP28 protein, also methods for treating these

PT cancers e.g. by vaccination with the protein -
XX
PS Claim 18; Page 80; 102pp; English.
XX
CC The present invention relates to methods and compositions for the
CC diagnosis and therapy of prostate cancer which utilise human SGP28
CC (specific granule protein 28) gene and proteins. The method involves
CC detecting cancers, particularly of prostate and colon, from
CC overexpression of SGP28 protein. The expression of SGP28, which is an
CC extracellular protein is restricted to the prostate and ovary, and is
CC markedly up-regulated in prostate tumours. SGP28 sequence is used for
CC diagnosis (including in vivo imaging), staging, monitoring and prognosis
CC of prostatic and colon cancer, and for assisting selection of therapy.
CC Also SGP28-expressing cancers can be treated by administering a
CC composition or vaccine that contains a vector expressing an antibody
CC specific for SGP28 protein, nucleic acid encoding SGP28 protein or its
CC fragments, polypeptides encoded by SGP28 gene and SGP28-specific antibody
CC optionally conjugated to toxin or therapeutic agent. SGP28 gene product
CC is also used as source of therapeutic antisense or ribozyme agents, as
CC primers/probes for diagnosis or prognosis, to identify compounds that
CC inhibit calcium entry into prostatic cells, for recombinant production
CC of SGP28 peptides and for isolating related sequences. SGP28 protein and
CC its fragments are used to raise specific antibodies (Ab) and to identify
CC specific binding agents (potentially useful as therapeutic and
CC diagnostic agents) and also potential anticancer agents. The present
CC sequence is human SGP28 peptide. This sequence binds to the human MHC
CC (major histocompatibility complex) class I molecule (human leucocyte
CC antigen) HLA-A2.

XX
PS Claim 34; Page 672; 675pp; English.
XX
CC AAX40438 to AAX40715 represent 5' expressed sequence tags (ESTs) for
CC human secreted proteins expressed in prostate, and encode the proteins
CC given in AAY11716 to AAY11993 respectively. The proteins given represent
CC the signal peptide and an N-terminal fragment of a secreted protein. The
CC nucleic acid sequences can be used for producing secreted human gene
CC products. They can also be used to develop products for diagnosis and
CC therapy. The proteins obtained may have cytokine activity, cell
CC proliferation and differentiation activity, haematopoiesis regulating
CC activity, tissue growth regulating activity, reproductive hormone
CC regulating activity, chemotactic/chemokinetic activity, haemostatic and
CC thrombolytic activity, receptor/ligand activity, anti-inflammatory
CC activity, tumour inhibition activity or other activities. The products
CC can be used in forensic, gene therapy and chromosome mapping procedures.
CC The sequences can also be used for obtaining corresponding promoter
CC sequences. The nucleic acids encoding the signal peptides can be used for
CC directing extracellular secretion of a polypeptide or the insertion of a
CC polypeptide into a membrane, or importing a polypeptide into a cell.

PT Detecting cancers, particularly of prostate and colon, from
PT overexpression of SGP28 protein, also methods for treating these
PT cancers e.g. by vaccination with the protein -
XX
PS Claim 16; Page 63; 102pp; English.
XX
CC The present invention relates to methods and compositions for the
CC diagnosis and therapy of prostate cancer which utilise human SGP28
CC (specific granule protein 28) gene and proteins. The method involves
CC detecting cancers, particularly of prostate and colon, from
CC overexpression of SGP28 protein. The expression of SGP28, which is an
CC extracellular protein is restricted to the prostate and ovary, and is
CC markedly up-regulated in prostate tumours. SGP28 sequence is used for
CC diagnosis (including in vivo imaging), staging, monitoring and prognosis
CC of prostatic and colon cancer, and for assisting selection of therapy.
CC Also SGP28-expressing cancers can be treated by administering a
CC composition or vaccine that contains a vector expressing an antibody
CC specific for SGP28 protein, nucleic acid encoding SGP28 protein or its
CC fragments, polypeptides encoded by SGP28 gene and SGP28-specific antibody
CC optionally conjugated to toxin or therapeutic agent. SGP28 gene product
CC is also used as source of therapeutic antisense or ribozyme agents, as
CC primers/probes for diagnosis or prognosis, to identify compounds that
CC inhibit calcium entry into prostatic cells, for recombinant production
CC of SGP28 peptides and for isolating related sequences. SGP28 protein and
CC its fragments are used to raise specific antibodies (Ab) and to identify
CC specific binding agents (potentially useful as therapeutic and
CC diagnostic agents) and also potential anticancer agents. The present
CC amino acid sequence is human full-length 36P1G3/SGP28 protein.

PT Nucleic acids encoding human immune/hematopoietic antigen polypeptides,
PT useful for preventing, diagnosing and/or treating cancers and
PT metastasis -
XX
PS Claim 11; SEQ ID NO 13134; 3071pp + Sequence Listing; English.
XX
CC AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I)
CC amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic
CC activity, and can be used in gene therapy and vaccine production. (I)
CC proteins and polynucleotides may be used in the prevention, diagnosis and
CC treatment of diseases associated with inappropriate (I) expression. For
CC example, they may be used to treat disorders associated with decreased
CC expression by rectifying mutations or deletions in a patient's genome
CC that affect the activity of (I) by expressing inactive proteins or to
CC supplement the patients own production of (I). Additionally, (I)
CC polynucleotides may be used to produce the secreted (I), by inserting
CC the nucleic acids into a host cell and culturing the cell to express the
CC protein. (I) proteins and polynucleotides may be used to prevent,
CC diagnose and treat immune/haematopoietic-related diseases, especially
CC cancers and cancer metastases of haematopoietic-derived cells. AAK64703
CC to AAK87694 represent human immune/haematopoietic antigen genomic
CC sequences from the present invention. AAK54942 to AAK54950 and AAM82169
CC represent sequences used in the exemplification of the present invention.

PT across the plasma membrane -

```
XX
PS   Claim 11; Page 258; 259pp; English.
XX
CC   The present sequence represents a calcium channel transport polypeptide.
CC   The polynucleotides, polypeptides, and antibodies are useful for
CC   preventing, treating, or ameliorating diseases associated with anomalies
CC   in calcium trafficking across the plasma membrane. They are used to
CC   diagnose, detect and treat or prevent diseases or conditions such as
CC   neural disorders (e.g. HIV-induced dementia), immune system disorders
CC   (e.g. rheumatoid arthritis), muscular disorders (e.g. muscle contractile
CC   dysfunction), reproductive disorders, gastrointestinal disorders,
CC   pulmonary disorders, cardiovascular disorders (e.g. arrhythmias), renal
CC   disorders, proliferative disorders, and/or cancerous diseases and
CC   conditions (e.g. lung carcinoma or breast cancer).

PT   New presenilin genes - useful for diagnosis, therapy and drug
PT   screening of familial Alzheimer's disease, cerebral disorders, etc.
XX
PS   Claim 3; Page -; 178pp; English.
XX
CC   AAW05736-W05760 represent mutated versions of the human presenilin-1-1
CC   protein (see AAW05733 for wild type sequence). AAW05734 represents a
CC   different wild type form of presenilin-1 that results from alternate
CC   splicing of the genomic DNA sequence. The presenilins are a family of
CC   highly conserved integral membrane proteins with a common structural
CC   motif, common alternate splicing patterns, and common mutational hot
CC   spot regions. Mutations in PS genes are implicated in familial
CC   Alzheimer's disease (AD) and possibly other diseases such as cerebral
CC   haemorrhage, schizophrenia, depression etc., so detection of mutations in
CC   the DNA encoding the wild type sequences can be used for diagnosis of
CC   these diseases. The wild type proteins, or vectors that express them or
CC   containing antisense sequences, antibodies selective for these mutant
CC   forms of the proteins and modulators of PS gene expression are
CC   potentially useful for treatment of AD etc. Transgenic animals are
CC   useful as models for drug screening. The antibodies can also be used e.g.
CC   for affinity purification and in immunoassays.

PT   Polynucleotide(s) and proteins derived from Staphylococcus aureus -
PT   stored on computer readable medium and used in the production of
PT   anti-S.aureus vaccines
XX
PS   Claim 23; Page 3252-3254; 3271pp; English.
XX
CC   This sequence represents a Staphylococcus aureus protein sequence of the
CC   invention. The DNA sequences encoding the S.aureus proteins are recorded
CC   on a computer readable medium, preferably selected from a floppy or hard
CC   disk, random access memory (RAM), read-only memory (ROM) or CD-ROM.
CC   Homology searches using the S.aureus DNA sequences allows putative
CC   functions to be assigned so that protein-encoding or regulatory regions
CC   of commercial, therapeutic or industrial importance can be obtained.
CC   Specifically, sequences which are likely to encode antigens have been
CC   identified and these polypeptides can be used in a vaccine composition
CC   against S.aureus infection. The polypeptides can also be used in a kit
CC   for the immunodetection of S.aureus in a sample. S.aureus is implicated
CC   in numerous human diseases, including cellulitis, eyelid infections, food
```

CC poisoning, osteomyelitis, skin and surgical wound infections, scalded
CC skin syndrome, toxic shock syndrome, etc. Organisms transformed with the
CC DNA sequences can be used for recombinant production of the polypeptides.
CC The new DNA sequences (and their fragments) are useful as primers or
CC probes for isolating homologues of any of the 5191 S.aureus DNA sequences
CC contained on the computer readable medium.

XX
PS Claim 34; Page 593; 675pp; English.
XX
CC AAX40438 to AAX40715 represent 5' expressed sequence tags (ESTs) for
CC human secreted proteins expressed in prostate, and encode the proteins
CC given in AAY11716 to AAY11993 respectively. The proteins given represent
CC the signal peptide and an N-terminal fragment of a secreted protein. The
CC nucleic acid sequences can be used for producing secreted human gene
CC products. They can also be used to develop products for diagnosis and
CC therapy. The proteins obtained may have cytokine activity, cell
CC proliferation and differentiation activity, haematopoiesis regulating
CC activity, tissue growth regulating activity, reproductive hormone
CC regulating activity, chemotactic/chemokinetic activity, haemostatic and
CC thrombolytic activity, receptor/ligand activity, anti-inflammatory
CC activity, tumour inhibition activity or other activities. The products
CC can be used in forensic, gene therapy and chromosome mapping procedures.
CC The sequences can also be used for obtaining corresponding promoter
CC sequences. The nucleic acids encoding the signal peptides can be used for
CC directing extracellular secretion of a polypeptide or the insertion of a
CC polypeptide into a membrane, or importing a polypeptide into a cell.

PT   Nucleic acids encoding polypeptides with cytokine-like activities,
PT   useful in diagnosis and gene therapy -
XX
PS   Claim 20; Page 3830; 6221pp; English.
XX
CC   The invention relates to polynucleotides (AAK51456-AAK53435) and the
CC   encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to
CC   cytokine, cell proliferation or cell differentiation or which may induce
CC   production of other cytokines in other cell populations. The
CC   polynucleotides and polypeptides are useful in gene therapy, vaccines or
CC   peptide therapy. The polypeptides have various cytokine-like activities,
CC   e.g. stem cell growth factor activity, haematopoiesis regulating
CC   activity, tissue growth factor activity, immunomodulatory activity and
CC   activin/inhibin activity and may be useful in the diagnosis and/or
CC   treatment of cancer, leukaemia, nervous system disorders, arthritis and
CC   inflammation.
CC   Note: Records for SEQ ID NO 2110 (AAK52581), 2111 (AAK52582) and 3666
CC   (AAM80020) are omitted as the relevant pages from the sequence listing
CC   were missing at the time of publication.

PT   Primer sets for synthesizing polynucleotides, particularly the 5602
PT   full-length cDNAs defined in the specification, and for the detection
PT   and/or diagnosis of the abnormality of the proteins encoded by the
PT   full-length cDNAs -
XX
PS   Claim 8; SEQ ID 11546; 2537pp + CD ROM; English.
XX
CC   The present invention describes primer sets for synthesising 5602
CC   full-length cDNAs defined in the specification. Where a primer set
CC   comprises: (a) an oligo-dT primer and an oligonucleotide complementary
CC   to the complementary strand of a polynucleotide which comprises one of
CC   the 5602 nucleotide sequences defined in the specification, where the
CC   oligonucleotide comprises at least 15 nucleotides; or (b) a combination
CC   of an oligonucleotide comprising a sequence complementary to the
CC   complementary strand of a polynucleotide which comprises a 5'-end
CC   sequence and an oligonucleotide comprising a sequence complementary to a
CC   polynucleotide which comprises a 3'-end sequence, where the
CC   oligonucleotide comprises at least 15 nucleotides and the combination of
CC   the 5'-end sequence/3'-end sequence is selected from those defined in
CC   the specification. The primer sets can be used in antisense therapy and
CC   in gene therapy. The primers are useful for synthesising polynucleotides,
CC   particularly full-length cDNAs. The primers are also useful for the
CC   detection and/or diagnosis of the abnormality of the proteins encoded by
CC   the full-length cDNAs. The primers allow obtaining of the full-length
CC   cDNAs easily without any specialised methods. AAH03166 to AAH13628 and
CC   AAH13633 to AAH18742 represent human cDNA sequences; AAB92446 to
CC   AAB95893 represent human amino acid sequences; and AAH13629 to AAH13632
CC   represent oligonucleotides, all of which are used in the exemplification
CC   of the present invention.

PT   Primer sets for synthesizing polynucleotides, particularly the 5602
PT   full-length cDNAs defined in the specification, and for the detection
PT   and/or diagnosis of the abnormality of the proteins encoded by the
PT   full-length cDNAs -
XX
PS   Claim 8; SEQ ID 11878; 2537pp + CD ROM; English.
XX
CC   The present invention describes primer sets for synthesising 5602
CC   full-length cDNAs defined in the specification. Where a primer set
CC   comprises: (a) an oligo-dT primer and an oligonucleotide complementary
CC   to the complementary strand of a polynucleotide which comprises one of
CC   the 5602 nucleotide sequences defined in the specification, where the
CC   oligonucleotide comprises at least 15 nucleotides; or (b) a combination
CC   of an oligonucleotide comprising a sequence complementary to the
CC   complementary strand of a polynucleotide which comprises a 5'-end
CC   sequence and an oligonucleotide comprising a sequence complementary to a
CC   polynucleotide which comprises a 3'-end sequence, where the
CC   oligonucleotide comprises at least 15 nucleotides and the combination of
CC   the 5'-end sequence/3'-end sequence is selected from those defined in
CC   the specification. The primer sets can be used in antisense therapy and
CC   in gene therapy. The primers are useful for synthesising polynucleotides,
CC   particularly full-length cDNAs. The primers are also useful for the
CC   detection and/or diagnosis of the abnormality of the proteins encoded by
CC   the full-length cDNAs. The primers allow obtaining of the full-length
CC   cDNAs easily without any specialised methods. AAH03166 to AAH13628 and
CC   AAH13633 to AAH18742 represent human cDNA sequences; AAB92446 to
CC   AAB95893 represent human amino acid sequences; and AAH13629 to AAH13632
CC   represent oligonucleotides, all of which are used in the exemplification
CC   of the present invention.

PT   New polypeptides of human transcription factors and zinc finger
PT   proteins for diagnosing, treating or preventing disorders of
PT   neurological, immunological and cell proliferative disorders -
XX
PS   Claim 1; Page 123; 137pp; English.
XX
CC   The present sequence is human transcription factor and zinc finger
CC   protein (TFZN)-6. TFZN protein is useful for screening an agonist/
CC   antagonist and a compound that specifically binds to it or modulates
CC   its activity. The polypeptide is also useful as an immunogen for
CC   preparing antibodies which are useful for diagnosing a disease associated
CC   with abnormal expression of TFZN, and for detecting and purifying the
CC   protein from a sample. Polynucleotide encoding TFZN is useful as a probe
CC   or a primer and for assessing toxicity of a test compound. A composition
CC   comprising the polypeptide, its agonist or an antagonist is useful for
CC   treating a disease or condition associated with decreased or increased
CC   expression of functional TFZN. Examples of disorders associated with
CC   abnormal expression of TFZN include cell proliferative disorders (e.g.
CC   arteriosclerosis, cirrhosis, psoriasis, cancer), developmental disorders
CC   (e.g. anaemia, epilepsy), autoimmune/inflammatory disorders (e.g.
CC   acquired immune deficiency syndrome (AIDS), asthma, Crohn's disease,
CC   Gout), neurological disorders (e.g. Alzheimer's disease, Huntington's
CC   disease, dementia). The polypeptide and polynucleotide of the invention
CC   are further useful for analysing a proteome of a tissue or a
CC   cell type. The polynucleotide is also useful for creating knockin
CC   humanised animals (pigs) or transgenic animals (mice or rats) to model
CC   human disease.
